

CMSI 4072 — Project Status Sheet

Spring 2026

Accomplishments

- Decided on Node.js and Express for the backend and confirmed MongoDB Atlas as the database; both are now set up and running locally.
- Added working hyperlinks and navigation across all main pages so the app flows naturally between the search page, book detail page, and profile page.
- Built the book search page with a search bar and basic result cards to represent the core book lookup feature, with placeholder data for now.
- Built a book detail page displaying placeholder title, author, genre, and description, linked from search results.
- Started the MongoDB schema design for the User and Book collections

Scheduled Tasks

- Connect the search functionality to the backend to return real book results from the database.
- Wire up the registration form to the backend so new users can create accounts.
- Build out the shelf pages for Want to Read, Currently Reading, and Finished.
- Implement login and route protection for pages that require authentication.

Noteworthy Risks

- MongoDB Atlas free tier limits simultaneous connections, which could cause issues during testing. Mitigation: will write efficient queries and monitor usage to stay within the limit.
- Search and book detail pages currently display placeholder data. Prioritize search and login endpoints first to unblock the rest of the features.
