

CMSI 4072 — Project Status Sheet

Spring 2026

Accomplishments

- Connected the book search page to the Express backend; the search bar now queries MongoDB Atlas using a case-insensitive search across title, author, and ISBN fields
- Completed and pushed the Mongoose schema models for the User and Book collections, including bcrypt password hashing on the User model and the averageRating field on the Book model.
- The AuthController validates email format and password length, saves the User to MongoDB, and returns a signed JWT.

Scheduled Tasks

- Build out the three default shelf pages (Want to Read, Currently Reading, Finished) and connect the ShelfController endpoints to allow users to add and move books between shelves..
- Begin the ReviewController so users can submit a star rating and optional text review
- Implement the login endpoint and JWT-based route protection so that shelf, review, and social routes reject unauthenticated requests

Noteworthy Risks

- Login and route protection are not yet implemented, meaning all pages are currently accessible without authentication
- Cloudinary integration for book cover image uploads has not been started
